REASON FOR ALLOWANCE

1. Tsai discloses a structure of an anti-shock device for a building comprising a base, a carrier, a slide block, an a plurality of springs which resists a horizontal force, a slip concavity of a sunken round curve recess formed in the center of said base top surface and in the center of the carrier bottom surface, said slide block being situated between the two slip concavities. Nishibe et al discloses an overhead hoist transport system comprising an aseismatic device comprising of springs attached to a first platform. Schreiner discloses an overhead transportation device comprising a platform comprising damping bearing members for dampening of vibration. Medeot et al disclose a load dissipating and limiting device for application in anti-seismic work comprising a primary member which is connected to a secondary member by a cylindrical end element and an oleo-dynamic device. However, none of the references of record suggests an aseismatic device wherein a first platform comprises a plurality of second supporting rods for suspending and supporting heavy objects, whereby a spring pin decides a horizontal aseismatic value by adjusting quantities of the spring, and as long as a horizontal force that acts on the aseismatic device is greater than the horizontal aseismatic value, the positioning balls shifts away from the cavity for cushioning the horizontal force in the manner defined in the instant claims 1, 14 and in combination with other limitations of the claims. Therefore, claims 4-6, 8-13, 15-19, depending therefrom, are considered to be allowable.
